

## Science and modern technologies

There have always existed two opposite attitudes towards science and technological development. Some people agree that new technologies have made the world better for living, while others think that technology has caused many problems to the world. I agree with the first opinion that our world is becoming better for living with technological progress.

Firstly, technological progress has greatly improved people's living conditions, making our life more convenient. We have elevators taking us to the top of a skyscraper in just a few seconds; we have air conditioners to keep the indoor temperature comfortable; and we even have household robots now to help to take care of the housework. There are a lot of clever machines at home that make our lives easier and more enjoyable. Secondly, technology has also made communication much easier. The wide use of mobile phones, and wireless Internet made the way of daily communication easier. Mobile phones let us contact with others wherever they and we are. Thanks to them we can talk with our relatives for free and without time limits.

However, there are some people who are skeptical to our modern way of living and say that modern inventions such as the computer and television have made us lazy and less in touch with the real world. In the end I'd like to say that in my opinion people should use new technologies appropriately and adopt them for good purposes.
